

$Q = Q_0 + Q_1 + \dots + Q_n \in \mathbb{R}^{m \times n}$ notice its semi-orthogonal since $Q^T Q = I_n$

Notice $\Rightarrow a_j = Q_j c_j = Q Q_1^T c_1 + \dots + Q_j c_j, 0, \dots, 0]^T = Q_j^T c_j$
Let $R = [r_1 | \dots | r_n] \in \mathbb{R}^{m \times n}$ \Rightarrow

$A = QR = Q \begin{bmatrix} q_1^T & \dots & q_n^T \\ 0 & & q_n^T \end{bmatrix}$ notice its

upper-triangular
Full QR decomposition
Consider $\text{Full QR decomposition}$ $A = [a_1 | \dots | a_n] \in \mathbb{R}^{m \times n}$ ($m \geq n$), i.e. $a_1, \dots, a_n \in \mathbb{R}^m$ are linearly independent. Apply QR decomposition to obtain: $Q = [q_1 | \dots | q_n] \in \mathbb{R}^{m \times n}$ for $Q(A)$
Semi-orthogonal $Q_1 = [q_1 | \dots | q_n] \in \mathbb{R}^{m \times m}$ and upper-triangular $R_1 \in \mathbb{R}^{m \times (m-n)}$ where $A = Q_1 R_1$
Compute basis extension to obtain remaining $q_{n+1}, \dots, q_m \in \mathbb{R}^m$ where $\{q_1, \dots, q_m\}$ is **ONB** for \mathbb{R}^m . Notice $\{q_{n+1}, \dots, q_m\}$ is **ONB** for $Q(A)^\perp = \ker(A^T)$. Apply Q_2 to Q_1 to get $Q = [q_1 | \dots | q_m] \in \mathbb{R}^{m \times m}$ and $R = [R_1 | R_2] \in \mathbb{R}^{m \times m}$ where $A = QR$
Then **full QR decomposition** is $A = QR = [Q_1 | Q_2] \begin{bmatrix} R_1 \\ 0_{(m-n) \times n} \end{bmatrix} = Q_1 R_1$

Q is **orthogonal**, i.e. $Q^{-1} = Q^T$ so its a basis transformation
 $\text{proj}_{Q(A)} = Q Q^T$, $\text{proj}_{Q(A)^\perp} = Q_2 Q_2^T$ are **orthogonal** projections onto $C(A)$ and $C(A)^\perp = \ker(A^T)$ respectively
Notice: $Q_2^T = Q_1^T Q_1^T Q_2^T Q_2^T$

Generalizable to $\mathbb{C} \in \mathbb{C}^{m \times n}$ by changing transpose to conjugate-transpose

Lines and hyperplanes in $E^n (= \mathbb{R}^n)$

Consider **standard Euclidean space** $E^n (= \mathbb{R}^n)$ with standard basis $\{e_1, \dots, e_n\} \in \mathbb{R}^n$ with standard origin $0 \in \mathbb{R}^n$

A line $L = \text{span}\{c\}$ is characterized by direction $c \in \mathbb{R}^n$ ($n \geq 1$) and offset from origin $c \in \mathbb{R}^n$
It is customary that: n is a **unit vector**, i.e. $\|n\| = \|n\| = 1$
 $c \in \mathbb{R}^n$ is **closest point to origin**, i.e. $c \perp n$
If $c \perp n$ \Rightarrow $[n]$ not vector-subspace of \mathbb{R}^n [i.e. $0 \notin L$] i.e. L doesn't go through the origin
 L is affine-subspace of \mathbb{R}^n

If $c \perp n$ [i.e. $L = \text{span}\{c\} \cup \{c\}$] is vector-subspace of \mathbb{R}^n [i.e. $0 \in L$] i.e. L goes through the origin
 L has $\dim(L) = 1$ and orthonormal basis (ONB) $\{\hat{n}\}$

A hyperplane $P = (\mathbb{R}^n)^{\perp} = \{x \in \mathbb{R}^n, x \perp n\}$ is characterized by normal $n \in \mathbb{R}^n$ ($n \geq 1$) and offset from origin $c \in \mathbb{R}^n$
It represents an $(n-1)$ -dimensional slice of the n -dimensional space
It is customary that: n is a **unit vector**, i.e. $\|n\| = \|n\| = 1$
 $c \in \mathbb{R}^n$ is **closest point to origin**, i.e. $c \perp n$
With those $\Rightarrow P = \{x \in \mathbb{R}^n | x \cdot n = c\}$
If $c = n \cdot 0 \Rightarrow P = \{0\}$ not vector-subspace of \mathbb{R}^n [i.e. $0 \notin P$] i.e. P doesn't go through the origin
 P is affine-subspace of \mathbb{R}^n
If $c = n \cdot 0$ [i.e. $P = (\mathbb{R}^n)^{\perp}$] $\Rightarrow P$ is vector-subspace of \mathbb{R}^n
i.e. $0 \in P$ [i.e. P goes through the origin]
 P has $\dim(P) = n-1$

Notice $L = \text{span}\{n\}$ and $P = (\mathbb{R}^n)^{\perp}$ are **orthogonal** complements, so:
 $\text{proj}_L = \hat{n} \hat{n}^T$ is orthogonal projection onto L (along P)
 $\text{proj}_P = \text{id}_{\mathbb{R}^n} - \text{proj}_L = I_n - \hat{n} \hat{n}^T$ is orthogonal projection onto P (along L)
 $L \perp \text{im}(\text{proj}_L) = \ker(\text{proj}_P)$ and $P \perp \ker(\text{proj}_L) = \text{im}(\text{proj}_P)$

$\mathbb{R}^n = \text{span}\{Q_1 | \dots | Q_n\}$ i.e. all vectors $v \in \mathbb{R}^n$ uniquely decomposed into $v = v_1 + \dots + v_n$

Householder Maps: reflections

Two points $x, y \in \mathbb{R}^n$ are reflections w.r.t hyperplane $P = (\mathbb{R}^n)^{\perp} + c$ if:
1) The translation $\overrightarrow{xy} = y - x$ is **parallel** to normal n [i.e. $\overrightarrow{xy} \parallel n$]
2) Midpoint $m = 1/2(x+y)$ **lies** on P [i.e. $m \cdot n = c$]

Suppose $P = \{x \in \mathbb{R}^n | x \cdot n = c\}$ [i.e. n is normal to P]
Projecting level curves onto \mathbb{R}^n gives f 's **contour-map**

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

$\text{proj}_{L_1} = uu^T$ and $\text{proj}_{P_1} = I_n - uu^T \Rightarrow$

$\text{proj}_L = \text{proj}_{L_1} + \dots + \text{proj}_{L_n}$
Visualize as preserving component in proj_L then flipping component in proj_L

H_{ij} is **involuntary**, orthogonal and symmetric, i.e. $H_{ij} = H_{ij}^T = H_{ij}^{-1}$

Modified Gram-Schmidt

Go check Classical GM first, as this is just an alternative computation method
Let $P_1, \dots, P_n \in \mathbb{R}^{m \times n}$ [be **projector** onto hyperplane $(\mathbb{R}^n)^{\perp}$] i.e. orthogonal complement of line $\mathbb{R} q_j$

Notice: $P_{j+1} = I_m - Q_j Q_j^T = \left(I_m - \sum_{i=1}^j Q_i Q_i^T \right) = \prod_{i=1}^j P_i$

Re-state: $u_{j+1} = \left(I_m - \sum_{i=1}^j Q_i Q_i^T \right) u_{j+1}$
 $u_{j+1} = \left(\prod_{i=1}^j P_i \right) u_{j+1} = \left(\prod_{i=1}^j P_i \right) u_{j+1}$
Projectors P_1, \dots, P_n are iteratively applied to u_{j+1} removing its components along q_1 then along q_2 and so on...

Let $u_j = \left(\prod_{i=1}^j P_i \right) u_j$ i.e. a_k without its components along q_1, \dots, q_j

Notice: $u_j = u_j^{(j-1)}$ thus $q_j = u_j^{(j-1)} / \|u_j^{(j-1)}\|$ where $r_{jj} = \|u_j^{(j-1)}\|$

Iterative step:
Notice: $u_j^{(j)} = u_j^{(j-1)} - \left(\frac{u_j^{(j-1)} \cdot q_j}{\|q_j\|} \right) q_j$
i.e. each proj_{q_j} of MGS computes $P_i q_j$ (and projections under r_i) in one go

At start of iteration $j=1$, we have ONB $q_1, \dots, q_{j-2} \in \mathbb{R}^m$ and residual $u_j^{(j-1)}, \dots, u_n^{(j-1)} \in \mathbb{R}^m$

Compute $r_{jj} = \|u_j^{(j-1)}\| \Rightarrow q_j = u_j^{(j-1)} / r_{jj}$

For each $k \in \{j+1, \dots, n\}$ compute $r_{jk} = q_j \cdot u_k^{(j-1)} \Rightarrow u_k^{(j)} = u_k^{(j-1)} - r_{jk} q_j$

Next ONB $\{q_1, \dots, q_j\}$ and next residual $u_{j+1}^{(j)}, \dots, u_n^{(j)}$

NOTE: for $j=1 \Rightarrow q_1, \dots, q_{j-1} = \emptyset$ i.e. none yet
By end of iteration $j=n$ we have **ONB** $\{q_1, \dots, q_n\} \in \mathbb{R}^m$

$A = [a_1 | \dots | a_n] = [q_1 | \dots | q_n] \begin{bmatrix} r_{11} & \dots & r_{1n} \\ & \ddots & \\ & & r_{nn} \end{bmatrix} = QR$

corresponds to thin QR decomposition
Where $A \in \mathbb{R}^{m \times n}$ is full-rank, $Q \in \mathbb{R}^{m \times m}$ is semi-orthogonal, and $R \in \mathbb{R}^{m \times n}$ is upper-triangular

Classical vs. Modified Gram-Schmidt

These algorithms both compute thin QR decomposition

Computes at j th step:
Classical GS \Rightarrow j th column of Q and the j th column of R
Modified GS \Rightarrow j th column of Q and the j th row of R

Both have **flop** (floating-point operation) count of $O(2mn^2)$

NOTE: **Householder method** has $2(mn^2 - n^3)/3$ flop count, but better numerical properties

Recall: $Q^T Q = I_n$ check for loss of orthogonality with $\|I_n - Q^T Q\| = \text{loss}$

Classical GS $\Rightarrow \|I_n - Q^T Q\| = \text{Cond}(A)^2 \epsilon_{\text{mach}}$

Modified GS $\Rightarrow \|I_n - Q^T Q\| = \text{Cond}(A) \epsilon_{\text{mach}}$

NOTE: **Householder method** has $\|I_n - Q^T Q\| \leq \epsilon_{\text{mach}}$

Multivariate Calculus

Consider $f: \mathbb{R}^n \rightarrow \mathbb{R}$
When clear write j th component of input as x_j [i.e. $f(x) = f(x_1, \dots, x_n)$]

Level curve w.r.t. $c \in \mathbb{R}$ [i.e. all points s s.t. $f(x) = c$]
Projecting level curves onto \mathbb{R}^n gives f 's **contour-map**

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$

n_k **th order partial derivative** w.r.t x_k of f is $\frac{\partial^k f}{\partial x_k^k}$
