

$W(c_w) \triangleq st_{cnd}(b, st_{seq}(c, c_w), st_{skp})$, so
 $sc_{whl}(b, c)$ is a *fixpoint* of W .

1. Define $\forall i. w_i : \mathcal{S}_c$ where $w_0 \triangleq \perp$ and
 $w_{i+1} \triangleq W(w_i)$.

2. Define $w_\infty : \mathcal{S}_c$ where:

$$w_\infty(s) \triangleq \begin{cases} s' & \exists i. w_i(s) = s' \neq \perp \\ \perp & \text{o.w.} \end{cases}$$

3. $\forall s \in \Sigma$ ass $w_i(s) \downarrow \Rightarrow w_{i+1}(s) = w_i(s)$.

4. By **FT**, $sc_{whl}(b, c) = w_\infty$.
