

Joining threads using an MVar:

```
thread :: ... -> MVar () -> IO ()
```

```
thread ... handle = do
```

```
  -- Indicate that this thread has finished
```

```
  putMVar handle ()
```

```
main = do
```

```
  handle <- newEmptyMVar
```

```
  forkIO (thread ... handle)
```

```
  -- Wait for thread to finish: blocks until there is something to take
```

```
  takeMVar handle
```

Getting a value from a thread join:

```
thread :: ... -> MVar Int -> IO ()
```

```
thread ... handle = do ...
```

```
  result <- ...
```

```
  -- Indicate that this thread has finished, providing a result
```

```
  putMVar handle result
```

```
main = do
```

```
  handle <- newEmptyMVar
```

```
  forkIO (thread ... handle)
```

```
  -- Wait for thread to finish and get its result
```

```
  result <- takeMVar handle
```
