

Answer Configurations

*Together with the definition of an operational semantics, one needs to define the **answer configurations**. Answer configurations are those configurations which are in normal form, and which describe the answer of some computation.*

The answer configurations of $\rightarrow_e$ are $\langle n, s \rangle$, where $n \in \mathbb{N}$.

The answer configurations of $\rightarrow_b$ are $\langle bv, s \rangle$, where $bv \in \{true, false\}$.

The answer configurations of $\rightarrow_c$ are $\langle skip, s \rangle$.
