

1 copy PC th item of list in P to N (halting if $PC > \text{length of list}$);
goto **2**

2 if $N = 0$ then halt, else decode N as $\langle\langle y, z \rangle\rangle$; $C ::= y$; $N ::= z$;
goto **3**

{at this point either $C = 2i$ is even and current instruction is $R_i^+ \quad L_z$,
or $C = 2i + 1$ is odd and current instruction is $R_i^- \quad L_j, L_k$ where $z = \langle j, k \rangle$ }

3 copy i th item of list in A to R ; goto **4**

4 execute current instruction on R ; update PC to next label; restore
register values to A ; goto **1**
